# Two questions

- ▶ Do socioeconomic differences affect the rate of SeeClickFix usage?
- ▶ My analysis suggests: **No** (or not strongly).
- ▶ Is the County more likely to close issues based on socioeconomic differences?
- ▶ My analysis suggests: **yes**.

# Combining two types of data

## SeeClickFix reports to Anne Arundel County

- 11/7/21 – 10/31/22
- For 35 zip codes, excluding ones that are almost completely nonresidential
  - Unfortunately, some extend into other counties.
- Total: 20,733 records

## Socioeconomic data

- Sources:
  - IRS
  - Census Bureau's American Community Survey
- Types of difference between zip codes:
  - Median **age**
  - **Income**
    - Average income (AGI)
    - Poverty rate (low correlation with average income)
  - **Ethnicity**: percentage identifying as non-Hispanic White
  - **Education**: percentage with Bachelor's degree
  - **Immigration**: percentage foreign-born

# Socioeconomic clustering\*

- Clearest separation mathematically is into two groups
  - But could produce any number, if desired
- Might get a different result by:
  - Weighting some factors more heavily
  - Choosing a different group of factors
- \*Clustered using the K-means method

## SECTION 1

# Do socioeconomic differences affect the rate of SeeClickFix usage?

# Does the rate of SCF reports differ across zip codes?

The per-capita rate of reports is similar across zip codes with different socioeconomic profiles.

Knowing the population size accounts for **83 percent\*** of the differences in reports among zip codes.

Socioeconomic differences explain, *at most*, 12 percent of the differences in reporting – and probably less.

Most of the remaining variation is probably due to differences in other, unrelated features of the zip codes, such as the existence of major roads, parks, or businesses that would provoke additional reports.

\*The percentages come from random forest regression.

# Summary of Part 1

- ▶ Socioeconomic differences do not lead to large differences in SCF reporting.
- ▶ That is, this tool seems to have similar adoption across zip codes despite their different mixes of ages, incomes, ethnicities, education, and immigration.

## SECTION 2

# Do socioeconomic differences lead to different responses by the County?

# Preliminaries

## Two methods of analysis

1. Comparing socioeconomic clusters to closure rates
2. 'Random forests'
  - A flexible and accurate approach
  - It measures:
    - The influence of all factors combined
    - The contribution of each factor

## 'Closed' = response

The analysis assumes that the SeeClickFix status of "Closed" reflects a meaningful response by the County

- Vs. "Open" and "Acknowledged"
- Due to anomalies, I didn't analyze the time until closure – but this could be used for analyses in the future.

## Unknown processes

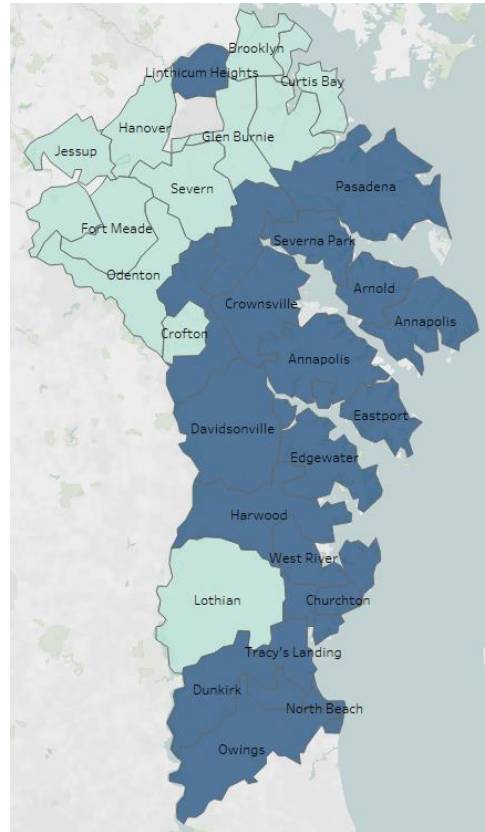

This analysis can reveal unequal results but not the processes that produce them.

# Clustering: demographics vs. closure rates

The amount of overlap (**76%\***) suggests that these *socioeconomic differences are a modestly good predictor* of the County's response to SCF reports. Thus, by this measure *socioeconomic differences seem to matter*.

## Zip codes clustered by socioeconomic indicators:

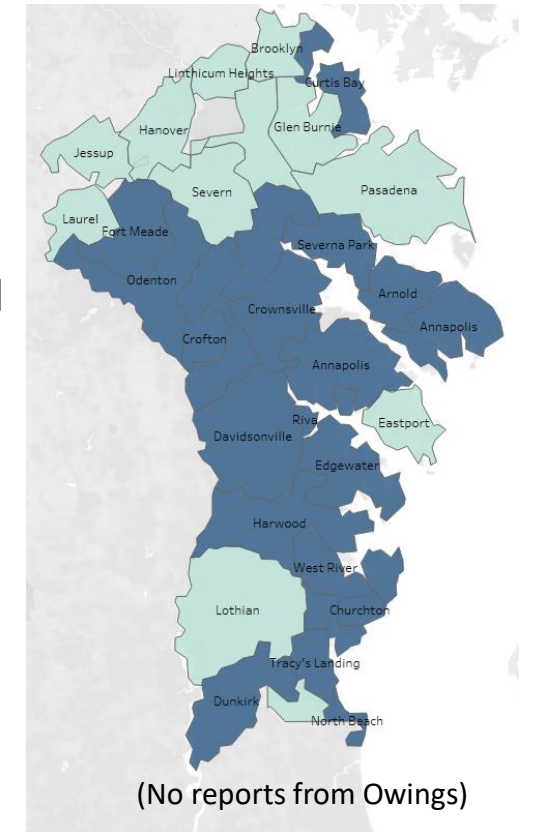

Data for the entire zip code is included for those that extend beyond the county's border.

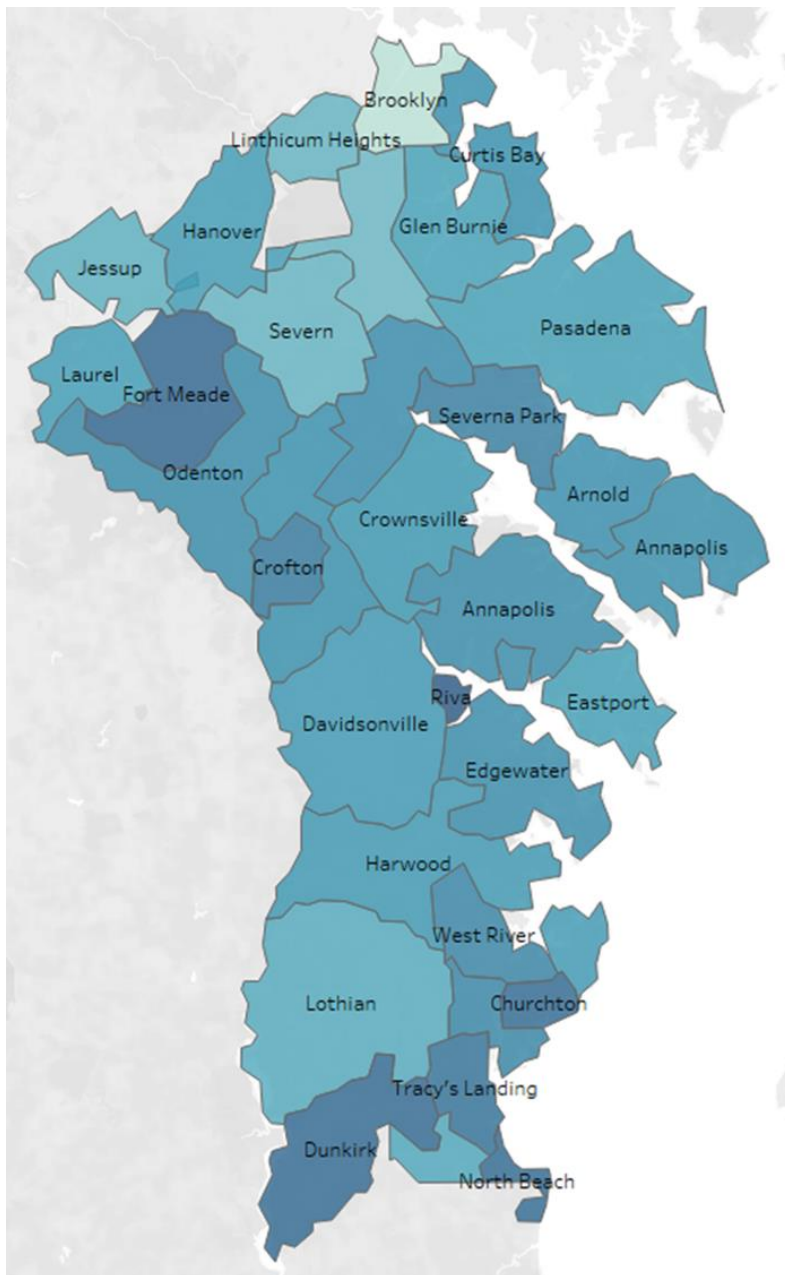

## Zip codes grouped by SCF closure rates:

The closure rates apply only to the parts in Anne Arundel County.

The 22 zip codes with the highest closure rates are dark.

\*In this case, a useless predictor would produce an overlap of 65%, versus 100% for a perfect predictor.

# Heat map of closure rates

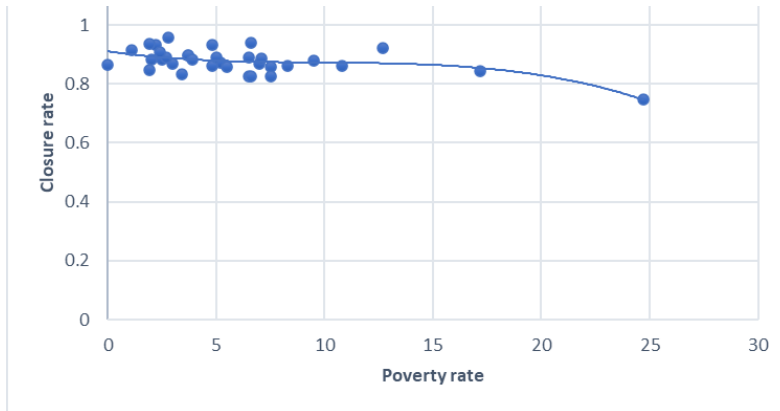

- 75% ('Brooklyn') to 96% (Riva)
- Other features, including the distance from County facilities, are also influential.

# Random forests: All issues combined

- ▶ 87% of the reports were closed. We are interested in explaining the 13% that remained open.
- ▶ By themselves, socioeconomic indicators predicted closure with 57% accuracy.
  - Random guessing would result in 50% accuracy, so their influence is modest.
- ▶ The relative importance of factors:
  - **Income: 53%**
    - Average income: 33%
    - Poverty rate: 19%
  - **Education (BA/BS): 28%**
  - **Ethnicity (Non-Hispanic White population): 16%**
  - Age had negligible importance, and immigration had none.

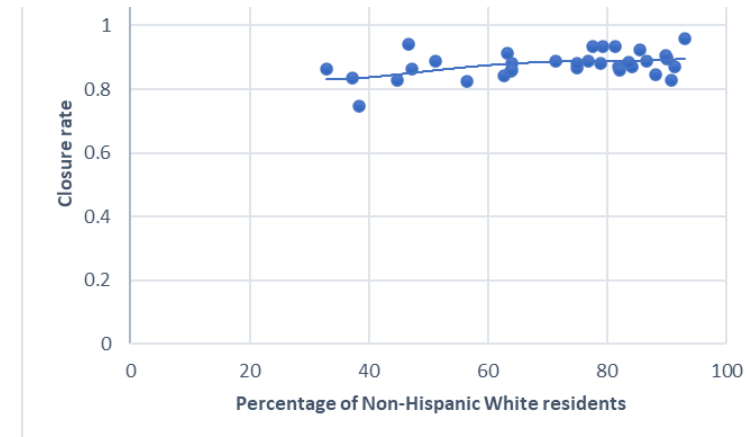

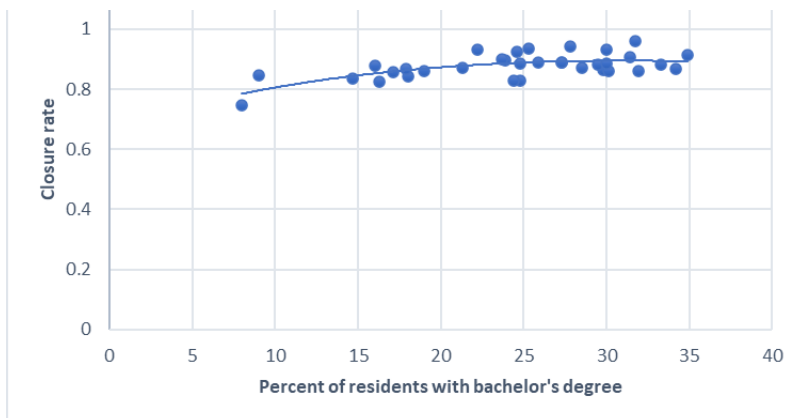

# Visualizing the relationships: mildly significant factors

Closure decreases  
as poverty  
increases.

Closure increases  
with income  
except at the  
highest range.

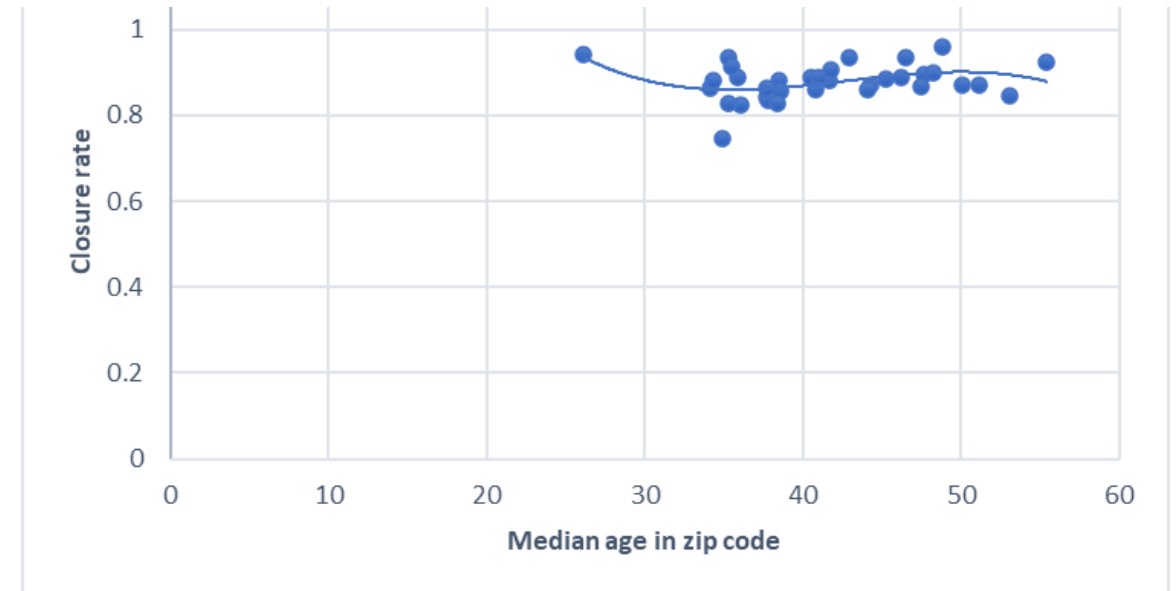

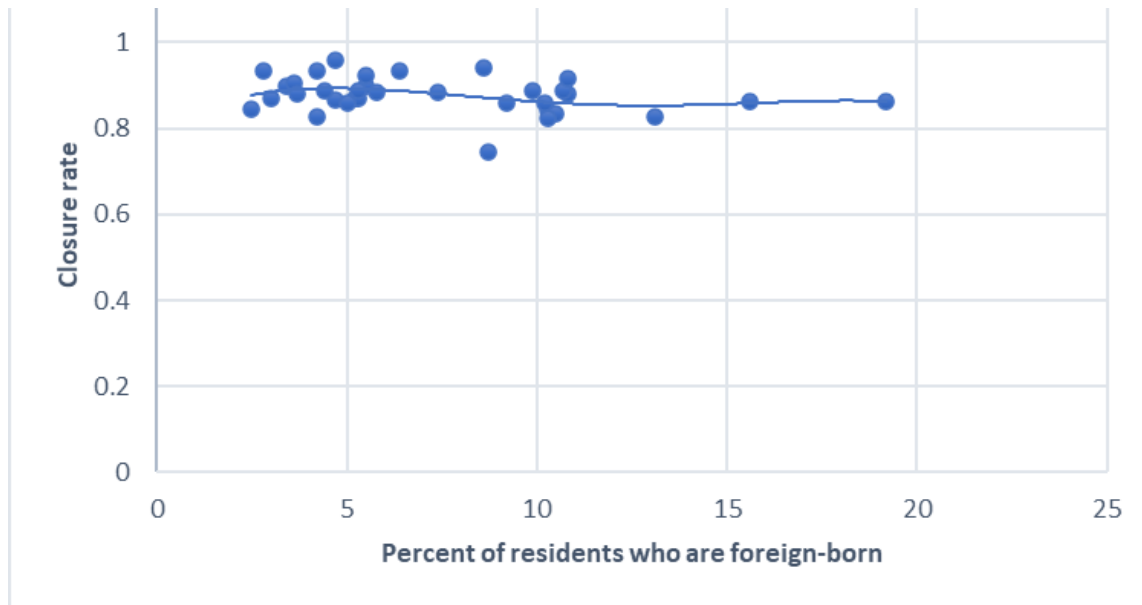

Closure increases  
with education.

Closure increases  
with the  
percentage of  
White, non-  
Hispanic residents.

# Visualizing the relationships: not significant

However, age and immigration *are* important for specific issues, as seen in later slides.

# Random forests: Closure rates by issue

- ▶ 53 issue types were reported via SeeClick Fix.
- ▶ 21 issues could not be analyzed using random forests, mostly due to an extremely high closure rate and/or high equity.
  - In these cases, any inequity in closure rates must be small.
- ▶ 31 of the remaining 32 issues were closed less equitably than the average.
  - For these 32 issues, this set of socioeconomic indicators is significant in predicting which reports don't get closed.

# No apparent inequity

Issue	Dept	Div	Count	Closure rate
Report Missed Curbside Collection	DPW	Waste Management	3520	98%
Road Maintenance	DPW	Highways	569	98
Comment On Trash Service	DPW	Waste Management	503	94

# Example:

## ‘Request a new recycling container’

Issue	Dept	Div	Count	Closure	Accuracy	Age	White	Poor	Income	Education	Immigrant
Request a new Recycling Container	DPW	Waste management	3868	89%	71%	10%	24%	12%	40%	2%	12%

Handled by Waste Management in Public Works

3868 requests – the most common issue

89% of requests were closed. We’re interested in explaining the 11% that remained open.

Socioeconomic differences alone can predict which reports were closed with 71% accuracy.

In order, the major factors were:

- 52%: income inequality
  - 40%: average income
  - 12%: poverty rate
- 24%: percentage of non-Hispanic White residents
- 12%: percentage of foreign-born residents
- 10%: median age

# Example:

## ‘Junk violation’

Issue	Dept	Div	Count	Closure	Accuracy	Age	White	Poor	Income	Education	Immigrant
Junk Violation	P&Z	Code compliance	265	60%	66%	13%	14%	18%	20%	17%	18%

Handled by Code Compliance in Planning and Zoning

265 reports

60% were closed. We’re interested in explaining the 40% that remained open.

Socioeconomic differences alone can predict which reports were closed with 66% accuracy.

In order, the major factors were:

- 38%: income inequality
  - 20%: average income
  - 18%: poverty rate
- 18%: percentage of foreign-born residents
- 17%: percentage of residents with bachelor’s degree
- 14%: percentage of non-Hispanic White residents
- 13%: average age

# Apparently inequitable, but few reports

Issue	Dept	Div	Count	Closure	Accuracy	Age	White	Poor	Income	Education	Immigrant
Interior Sanitation or Maintenance	Health Department		27	52%	74%	16%	35%	19%	12%	7%	11%
Stagnant Swimming Pool	DPW	Utilities	25	56	72	12	25	13	16	15	19
Open Burning	Health Department		23	83	87	13	21	18	17	18	14
Stagnant Water	Health Department		20	75	85	16	17	11	18	18	20
Septic System - Sewage overflow	Health Department		20	50	75	12	11	33	13	18	12
Mold	Health Department		11	64	91	11	25	9	18	21	16
Other Concerns	Constituent Services		7	57	86	14	17	19	19	18	13

*Results become less reliable as cases decrease.*

# Summary of Part 2

- ▶ For some issues, socioeconomic differences led to moderate differences in the County's response.
- ▶ That is, the County is more likely to close some types of issues based on who lives in the area.

# Conclusion

- ▶ Socioeconomic differences do not significantly affect the adoption of SeeClickFix. But they do affect the County's response.
- ▶ This could be monitored on a regular basis.
  - Optimally, the data would also include issues reported through other means – such as by phone and email.
  - A better level of analysis would be the census tract.
- ▶ Questions? Comments? [exduva22@aacounty.org](mailto:exduva22@aacounty.org)
